

Place the Power of Shipping into Your Hands!

GlobalShip™ is a robust, enterprise class, multi-carrier parcel and LTL shipping software designed for companies of any size. This true N-Tier based application utilizes the .NET Framework, Java and SQL to facilitate the high-speed processing of hundreds of thousands of transactions daily. The LogiCOM API and EAI framework facilitate a seamless interface to other enterprise applications currently being used by the customer including: ERP, WMS, print and apply, or web storefront through XML messaging. The LogiCOM Business Logic Engine (BLE) also allows for customer specific business logic and/or rules to easily be applied to the shipping environment without having to make any modifications to the base shipping engine.

Features & Benefits:

Parcel Carrier Support

GlobalShip is a multi-carrier suite of shipping solutions allowing you to process both domestic and international shipments with the following small parcel carriers:

- DHL
- FedEx
- UPS
- USPS
- Canada Post
- Purolator
- OnTrac
- and many more

Regional Small Parcel, LTL, TL and Private Fleet Carriers

GlobalShip automates your LTL, TL, private fleet and regional small parcel carriers on one integrated system:

- Create an unlimited number of custom user defined small parcel and LTL carriers
- Supports both international and domestic carriers
- Supports Czarlite™ rating and routing files
- Allows integrators to define custom logic for rating, shipping, delivery commitments, tracking numbers, EDI, etc.
- Supports complex modal moves like zone skipping

Service and Support

Logikor understands just how critical your shipping system is to the operation of your entire business. Because of this, we make ourselves available when you need us by offering industry leading 24 x 7 phone and web-based technical support. Logikor clients also receive necessary product and carrier rate updates throughout the year.

Integration

The GlobalShip solution is tightly connected with our LogiCOM middleware API and business logic engine for seamless integration to other enterprise solutions including, but not limited to: Warehouse Management Systems (WMS), Enterprise Resource Planning systems (ERP), order entry, web shopping cart applications, etc. The GlobalShip solution can also be integrated with ease to handheld RF devices, material handling applications or in-motion high-speed print & apply. Advanced functions like multi-threaded routing and event management are standard in this integration tier.

Real-time integration translates into real-time information. There is not a need to wait for data entry clerks to manually change the status within your enterprise system or enter in shipping charges. Your customers now have access to real-time order and shipping status information from you via email notification or your customer facing web site.

This high performance integration allows for decreased handling, improved product flow-through, order tracking, and optimal customer service. Also, by pre-setting automated shipping rules, errors will be reduced throughout the fulfillment process, for a reduced cost-per-package.

Business Rules

GlobalShip allows for flexible and customer personalized business rules through the Business Logic Engine. These unique business rules may be built by Logikor, or by the customer for continual improvement in the overall fulfillment process.

Operation in Multiple Modes

GlobalShip allows you to operate in multiple modes simultaneously. Integration can be done in "black box" mode using your ERP's screens to ship so that the system operator doesn't need to adjust to a different application look or feel. Using GlobalShip in "desktop" mode allows users to ship from anywhere to anywhere using the customizable GlobalShip shipping screen. Or, you can use them both simultaneously for complete flexibility.

Rate Shopping and Routing

Save time and money by considering a number of parameters, including projected time of delivery, destination and available carriers, to determine the optimal carrier and type of service. This function is available up-stream in the workflow process at the time of Order Entry, can be done automatically without any user intervention, or GlobalShip can list the carriers and services available for the user to make the selections manually.

Web-Based Desktop Shipping

With the browser based user interface GlobalShip can adapt to the desktop via the Internet allowing anyone in the corporate environment the ability to execute a shipment whether they are in the warehouse, executive offices, or the field sales office. This architecture also allows for the addition of shipping locations by simply adding another workstation to the network.

Bar Code Scanning

It is a goal of GlobalShip to eliminate the need for manual data entry. Re-keying information results in errors and mis-shipments, which can cost your company additional expenses. The accuracy achieved using barcode technology significantly reduces these risks.

**Solution
Grows as
You Grow**

GlobalShip allows for unlimited company growth:

- Supports unlimited users
- Supports unlimited company/location combinations
- Can scale incrementally upward to higher performance

**Material
Handling
Automation**

Reduce the risk and time-to-production using an interface that's been tested and proven successful with material handling PLCs.

**VICS Bill
Of Lading**

GlobalShip can generate a VICS Bill of Lading (BOL) for all your LTL and TL shipments. Also, if you have the LTL and TL carrier rating module, GlobalShip can automatically calculate the most economical carrier for you needs.

**LTL and TL
Carriers
Rating**

GlobalShip enables you to manage an unlimited number of rate tables for LTL and TL carriers. List and/or negotiated rates may be received from your carriers in electronic format. Once they are uploaded into the system, GlobalShip may access them for purposes of generating a BOL, manifest, rate calculation, rate shopping, etc.

In addition to the common carriers, GlobalShip may be used to manage a private fleet. By creating a rate table for them, GlobalShip can assist you in determining the most cost effective means of shipping an order.

**LTL and TL
Carriers
Consolidation**

The Consolidation module assists the user to consolidate LTL and TL shipments based on the customer and the destination address. It also allows the user to select another carrier or service, and assigns a PRO number for tracking shipments that have been consolidated.

**Wireless
Shipping**

GlobalShip enables you to pick items, place them directly into a box and generate a shipping label all from a hand held wireless RF terminal. GlobalShip eliminates the need to weigh each box before generating a shipping label.

**Retail
Compliance**

GlobalShip manages an extensive library of UCC 128 compliance labels. This label will be generated in addition to your shipping label for all customers that require an 856 Advanced Ship Notice (ASN).

**International
Shipments**

GlobalShip generates all of your customs documentation (including NAFTA, CI, CO, SED, CN22, etc.) on the fly. This gives you the capability to electronically complete each form with the necessary shipment information. These documents are printed at the time an order is shipped.

**Order Entry
Rate Shop**

Order Entry rate shop enables your company to quote and shop actual carrier rates while your customer is still on the line or at your web site. It also allows you the ability to add the correct shipping charge to the customer invoice prior to order shipment.

GlobalShip is capable of generating results to a rate shop request at any time during your order cycle. By using the estimated weights from your ERP item master, GlobalShip can rate and even print shipping labels prior to order picking.

Carrier Reports and Labels

GlobalShip provides the carrier required reports and labels for all your common, small parcel and freight carriers. GlobalShip provides the flexibility to develop customized reports for internal use as well.

Dual Rating

GlobalShip dual rating manages two separate rates for each box it processes. One rate will be the negotiated rate and will be used for manifest purposes. A second rate may be used for invoicing purposes. This second rate may include one of the below items or a combination, allowing your complete flexibility.

- Fixed handling fees
- Fixed discounts/markups
- Percentage discounts/markups
- Destination based rate matrixes
- Different carrier's rates (allowing you to process a shipment under one carrier, and charge the customer using rates from another carrier)

Consolidation

GlobalShip has the ability to consolidate shipments based upon a variety of parameters including ship to address, carrier, type of service, etc. Even boxes with different order numbers may be consolidated for hundredweight and other discounted carrier services without any user intervention.

Multiple Orders per Box

Do you ever ship multiple orders for a customer in a single box? GlobalShip enables you to track orders individually and appropriate proportionally the shipping charges to the individual orders.

Custom Screens

Build and modify delivered shipping screens to meet your exact shipping flow.
